The peptide antagonists are based on a common mortif of ZOT cC and human zonulins, which is believed to be critical for receptor cC antiinflammatory agents in the treatment of gastrointestinal cC antiinflammatory agents in the treatment of gastrointestinal cC and yet does not physiologically modulate the opening of TJ in the CC caused by infection, e.g. Clostridium difficile infection, cc caused by infection, e.g. Clostridium difficile infection, cc caused by infection, e.g. clostridium difficile infection, cc collagenous colitis, inflammatory bowel disease, diseases with cc correction of congenital heart disease with Fortan's gastric cancer, cc correction of congenital heart disease with Fortan's disease, cc e.g. systemic lupus erythematosus or food allergies, primarily to cc milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                               03-MAR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes for T-cells (T-cell epitopes) of the given come of the T-cell epitopes dentified in step (b) thereby to eliminate at least reduce the immunogenicity of the protein when exposed to the immune protein to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products peptides from humanised A33 heavy chain variable region predicted by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immunogenic responses is also provided. The methods can be used particularly for reduce the immunogenic responses is also provided. The methods can be used particularly for reduce the immunogenic responses is also provided. The methods can be used particularly for reduce the immunogenic responses is also provided. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent peptide theading.
The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the give
                                                                                                    of a given

                        This sequence represents a fragment of the IgG heavy chain. This sequence was isolated using the biomedical device of the invention, which comprises: (a) a biocompatible support; and (b) conglutinin which is covalently bound to the support. The device can be used for removing immune complexes (IC) from a fluid. This can be used for treating a mammal or for evaluating the status of a mammal. It can be used for treating diseases such as serum sickness, chronic immune complex nephritis, bacterial infections, viral infections, parasitic diseases, autoimmune diseases or neoplastic diseases. The devices can also be used for purification of IC and to study immune pathogenesis and antigens associated with a disease state. The covalently immobilised conglutinin can capture IC with high capacity and specificity and allows elution under mild conditions. The devices are stable with no loss of IC binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent peptides from humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IgG heavy chain; immune complex removal; conglutinin; infection;

                                                                                                                                             R82833 and R82834 represent the N-terminal sequences of the heavy chain cand light chain of an anti-human influenza A type virus antibody. The antibody these sequences were obtained from was isolated from hybridoma CC C179. The antibody recognises the stem region of the haemaglutinin (HA) CC molecule of the H1N1 and H2N2 subtypes of human influenza A type virus, and shows neutralisation activity against these two subtypes. The CC variable heavy chain sequence (see T04159) and the variable light chain CC coding sequence (see T04160) are useful in the production of artificial antibodies and antigen-binding polypeptides. These artificial antibodies and antigen-binding polypeptides. These artificial antibodies are useful in the diagnosis and treatment of human and considered the influenza. As the antibodies recognise the stem region of the HA molecule, the influenza virus will be recognised even if the HA molecule changes. This provides an advantage over current vaccines, as the virus considered the stem region of the HA molecule changes. This provides an advantage over current vaccines, as the virus of the virus of the HA molecule changes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, norepinephrine, phentolamine, doxapram, alfentanil, dezocin, nalbuphine, buprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine, mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin, vincristine, vinblastine, methicillin, mezlocillin, piperacillin, cetoxitin, cefenicid, cefmetazole and azreconam, a hormone e.g. testosterone, nandrolene, menotroppins, insulin, urofolitropin, interferon-alpha, interferon-beta, interferon-gamma, interleukin-1 (IL-1), IL-2, IL-4, IL-8, polyvalent IgG, specific IgG, IgA, or IgM. The proteins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-purification of zonulin. The present sequence represents an N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   molecular weight of 47 kD, as determined by SDS-PAGE, which is recognised by both anti-tau polyclonal antibody and by anti-zonula occludens toxin (ZDT) polyclonal antibody, and is capable of reversibly opening mammalian tight junctions. Zonulin proteins function as physiological modulators of mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa with a spents such as drugs, and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass1 mucosa and across tight junctions of intestinal and nass2 mucosa and across tight junctions of intestinal and nass2 mucosa and across tight junctions of intestinal and nass2 mucosa and across tight junctions in the intestinal and nass2 mucosa and across tight junctions in the intertion across tight junct
Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New purified zonulin - which is capable of reversibly opening mammalian tight junctions, used for enhancing the delivery of agents across intestinal and masal mucosa and blood brain barrier
                                                                    peptide of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of the N-terminal region of adult human heart zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (20T) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-braintestinal inflammation.

Framework regions (R87049-52) of human group III (gp3) germ line antibody heavy chain showed homology to corresponding regions (R87053-56, respectively) of the rat antibody. This homology monoclonal antibody 39D10 heavy chain (see R87039). This homolog was utilised in the prodn. of a humanised 39D10 VH (R87058) in which rat 39D10 VH complementarity determining regions were graff
                                                                                                                                                                                                                                                                                                                                                                                Anti-human IL-5 recombinant antibody reducing eosinophilia and for treating

The sequences are used to produce the antibodies of the invention. The specification describes chimeric human/rodent anti-CD3 antibodies, which have a rodent anti-CD3 immunoglobulin G [195] light chain variable region and a human heavy chain variable region. The blockade of the CD3 antigen-T-cell receptor (TCR) complex. They can used for immunosuppression, particularly for the control of graft rejection. The antibodies can also enhance or re-direct T-cell responses to antigens. They can be used in the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    R76965-R76579 are the Fab fragment heavy chain variable domains of human anti-herpes monoclonal antibodies. These antibodies are capable of neutralising both herpes simplex virus (HSV) types I and II by binding an epitope present on glycoprotein D. The antibody may be used for detecting HSV in vivo or in vitro; for passive immunotherapy (pref. prophylactically) of HSV infection (eg. genital, oral or ocular herpes), partic. as its Fab fragment and as a competitive reagent for detecting neutralising anti-HSV antibodies in a sample. Anti-idiotypic antibodies raised against the mAb can be used for active immunotherapy of HSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnosis; neutralisation;

                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                               CC 242265 to 243075 represent novel 5' expressed sequence tag (EST) CS sequences, corresponding to human secreted proteins. Y64651 to Y65438 CC represent the EST-related proteins corresponding to 242265 to 24352. CC The 5' ESTs can be used for producing secreted human gene products. CC and upstream regulatory regions which control the location, development CC stage, rate, and quantity of protein synthesis, as well as stability of CC mRNA. The ESTs are also useful as probes for chromosome mapping, and to CC procedures to identify individuals, or in diagnostic procedures to CC fine nucleic acids encoding signal peptides can be used for directing CC The nucleic acids encoding signal peptides can be used for directing CC polypeptide into a membrane, or importing a polypeptide into a cell. CC The proteins encoded by the EST sequences may be useful in treating a covariety of human conditions. Secreted proteins have therapeutic value, CC and the identification of new secreted proteins is valuable. Z42249 to CC 242264 and Y64644 to Y64650 represent sequences used in the

The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. Z42249 to 242244 and V46444 to Y64650 represent sequences used in the

Ig heavy chain V regions (3-24 and 5-14) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Apecies: Nus musculus (house mouse)
C; Accession: D31485
R; Bedzyk, W.D.; Johnson, L.S.; Riordan, G.S.; Voss Jr., E.W.
J Biol. Chem. 264, 1565-1569, 1989
A; Title: Comparison of variable region primary structures within an anti-fluorescein A; Reference number: A31485; MUID:89109167
A; Accession: D31485
A; Status: preliminary
A; Molecule type: protein
A; Residues: 1-36 < ABED>
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
A; Molecule type: mRNA
A; Residues: 1-30 <ANS>
A; Cross-references: EMBL:X73019
A; Cross-references: EMBL:X73019
C; Superfamily: lnmunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F; 1-38/Domain: immunoglobulin homology (fragment) <IMM>

J. Biol. Chem. 254:11418-11430(1979),
-1- MISCELLANEOUS: THIS ALPHA CHAIN WAS ISOLATED FROM A MYELOMA PROTEIN THAT CONTAINS ONE LIGHT AND ONE HEAVY CHAIN PER MOLECULE,
LINKED BY A DISULFIDE BOND. IN CONTRAST, NORMAL MOUSE IGA MOLECULES CONTAIN TWO LIGHT AND TWO HEAVY CHAINS AND LACK A
LIGHT-HEAVY CHAIN DISULFIDE BOND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=80049769; PubMed=115869; Robinson E.A., Appella E.;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq
